# Discussion of homework

- Use the output from the command `ps -eo user,rss,comm`.  
How to print the following information for every user that is working on the server?

`user_name`, `nproc=number_of_running_processes`,  
`rss=size_of_RSS_memory_alocatted_by_these_processes`

- Example of output

```
$> ps -eo user,rss,comm | nawk -f ps4.awk
```

User	NProc	RSS (KB)
-----		
kolensta	2	28888
root	94	689168
trdlicka	4	24448
klamovik	4	38112
...		

# Discussion of homework

- What information must the OS remember about every user?
- Where the previous information are stored?

- How to determine effective and real user identity of your shell?
- How to determine effective and real group identity of your shell?
- How to determine the owner and owner group of the file `/usr/bin/passwd`?
- How to print only access permissions of the directory `/etc`? What is the meaning of these permissions?

- Login to server `fray1.fit.cvut.cz`.
- What permissions has the directory `/bin` and what does it mean?

# Access permissions

- Create the following directory structure in your home directory and setup the same permissions (files passwd and date are copies of /etc/passwd and /bin/date, respectively). You and your primary group will be the owner and owner group.

```
dr-x----- user group ps1-09/  
dr-x----- user group ps1-09/A  
-r-x----- user group ps1-09/A/date  
-r-x----- user group ps1-09/A/passwd
```

- What minimal permissions (minimal sum of permission weights) must be set on files or directories, such that you can successfully execute the following commands?

- `ls -ld ~/ps1-09/A`

- `ls ~/ps1-09/A`

- `ls -l ~/ps1-09/A`

# Access permissions

- `ls -l ~/ps1-09/A/passwd`
- `cat ~/ps1-09/A/passwd`
- `echo "aaaaa" >> ~/ps1-09/A/passwd`

# Access permissions

- `echo "bbbbbb" > ~/ps1-09/A/passwd`
- `~/ps1-09/A/date`
- `rm ~/ps1-09/A/passwd`

# Default access permissions

- What access permissions will have new created directory and file? Why?
- What must be done to newly created files/directories should have automatically the following access rights (don't use command `chmod`)?

- `directory: rwx --- --- file: rw- --- ---`

- `directory: rw- -w- r-- file: rw- -w- r--`

# Command find

- How to print only the number of regular files, which are in the directory `/usr/bin` (recursively) on the standard output?
- How to print only the number of symbolic links, which are in the directory `/usr/bin` (recursively) on the standard output?
- How to print only the number of regular files and symbolic links, which are in the directory `/usr/bin` (recursively) on the standard output?

# Command find

- Create files and directory by the following commands.

```
mkdir -p A/B/C
```

```
touch {A,A/B,A/B/C}/\  
{,a,b,c}{,k,l,m}{,x,y,z}.{c,cpp,tar,gz,txt}
```

- 1 How to print names of regular files, which have a suffix of length 3.  
(eg. abc.txt or xz.cpp)?
- 2 How to print names of regular files, which consist of a prefix of length 2 and the suffix .c or .cpp (eg. ab.c or xz.cpp)?
- 3 How to remove files found in question 1?

- How to print names of regular files from your home directory (recursively), that were modified during today, and how to verify the result by the command `stat`?
- How to print names of regular files from your home directory (recursively), that were modified during last 3 days, and how to verify the result by the command `stat`?
- How to print only names of all regular files, which have set write permission for owner or exec permission for other and are located in the directory `/etc` (recursively)? For every such file run command `ls -l` to verify the permissions.

# Command find

- How to print only names of regular files, which are shell scripts and are located in the directory `/usr/bin` (recursively), on the standard output?

① Hint: The script is the file with the following first line

```
#!/bin/sh
```

② Hint: Use the command `file`.

- How to print all hard links of the file `/etc/init.d/pppd` in directory `/etc` (recursively) on the server `fray1.fit.cvut.cz`.

# Homework

- How to print names of regular files from your home directory, that have size bigger then 2 megabytes, and how to verify the result by the command `stat`?
- How to print names of all files from your home directory, that were accessed 7 days ago, and how to verify the result by the command `stat`?
- How to print names of regular files from the directory `/tmp`, that you can read, and how to verify the result by the command `ls`?
